DETAILED ACTION

Allowable Subject Matter

Claims 1, 3 and 4 are allowed.

Takayama shows a high frequency switch comprising a single input and single output terminal, further including first thru third diodes and first and second resistors but does not teach or suggest capacitors connected to the ends of the first and third diodes controls the on/off function or where the DC bias circuits connected thereto in order to apply the DC bias (claim 1); or a plurality of outputs (claim 3). The selection switches of Takayama connected to the diodes appear to be controlled independently of any associated capacitor.

Nelson shows a pin diode switch including first thru third diodes and first and second resistors but does not teach or suggest capacitors connected to the ends of the first and third diodes controls the on/off function or where the DC bias circuits connected thereto in order to apply the DC bias; or a plurality of first and second resistors provided in a plurality of terminated lines (claim 3). Like Takayama above, the bias sources of Nelson connected to the diodes appear to be controlled independently of any associated capacitor where Nelson only discloses the functionality of the $\lambda/4$ chokes blocking RF, nor would it be obvious to combine the prior art of record thus the claims are allowable.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dean O. Takaoka whose telephone number is (571) 272-1772. The examiner can normally be reached on 8:30a - 5:00p Mon - Fri.
